## Microservices: What is a Service?

### Microservices: Introduction

SOA done well

Knowing how to size a service

Traditional SOA resulted in monolithic services

Micro sized services provide

Efficiently scalable applications

Flexible applications

High performance applications

Application(s) powered by multiple services

Small service with a single focus

Lightweight communication mechanism

Both client to service and service to service

Technology agnostic API

Independent data storage

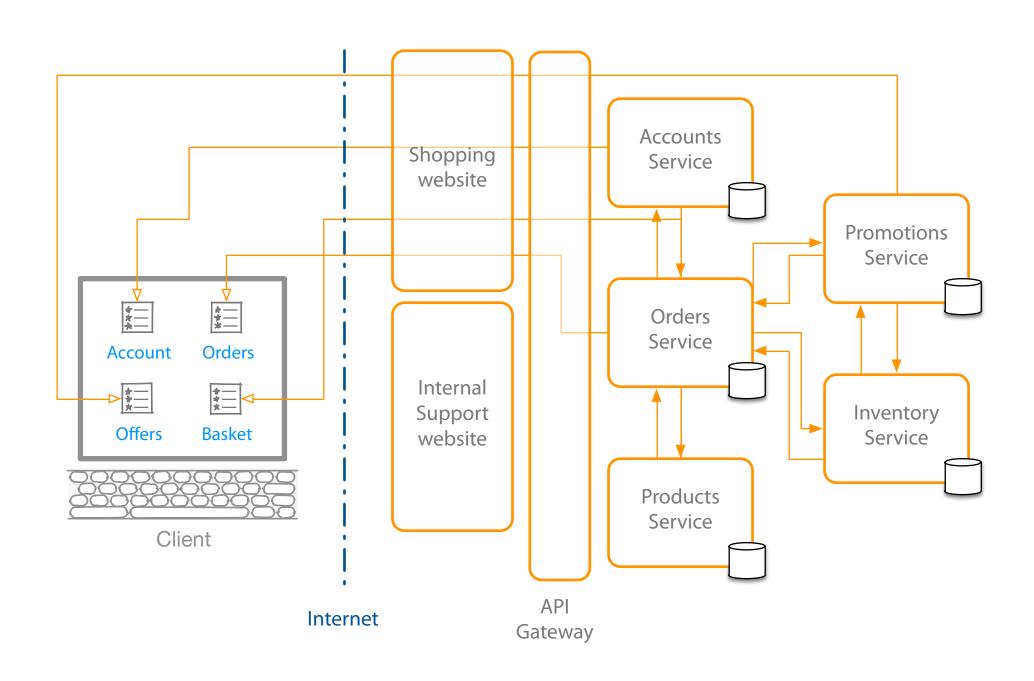

Independently changeable

Independently deployable

Distributed transactions

Centralized tooling for management

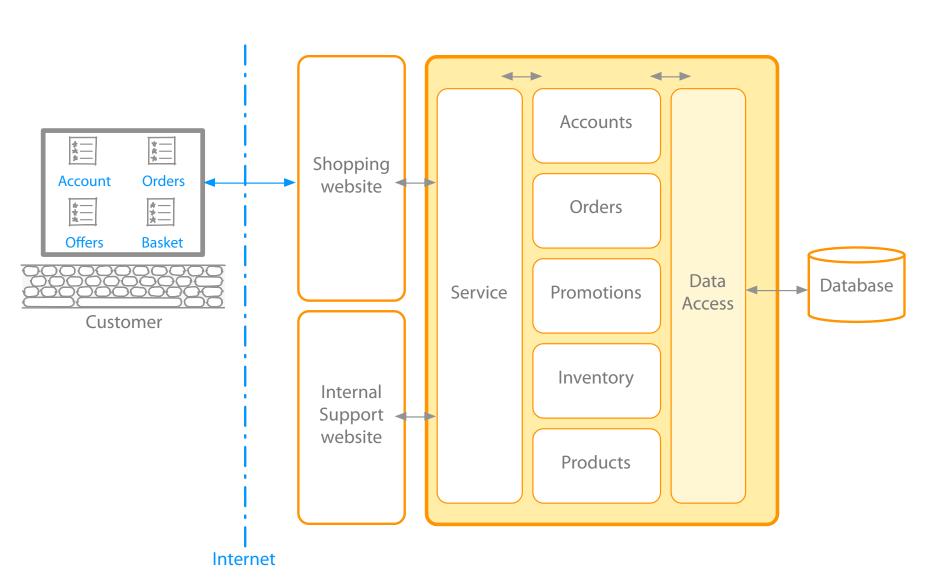

## Microservices: Introduction

### Microservices

What is a Service? | Introduction | The Monolithic

### Microservices: The Monolithic

Typical enterprise application

No restriction on size

Large codebase

Longer development times

Challenging deployment

Inaccessible features

Fixed technology stack

High levels of coupling

Between modules

Between services

Failure could affect whole system

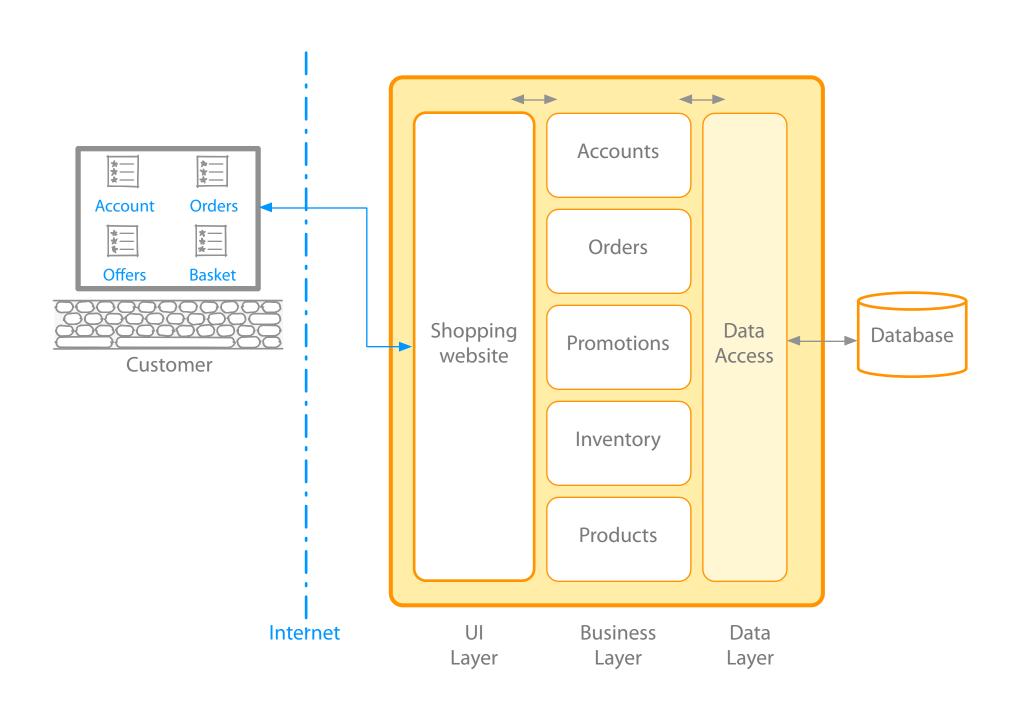

Scaling requires duplication of the whole

Single service on server

Minor change could result in complete rebuild

Easy to replicate environment

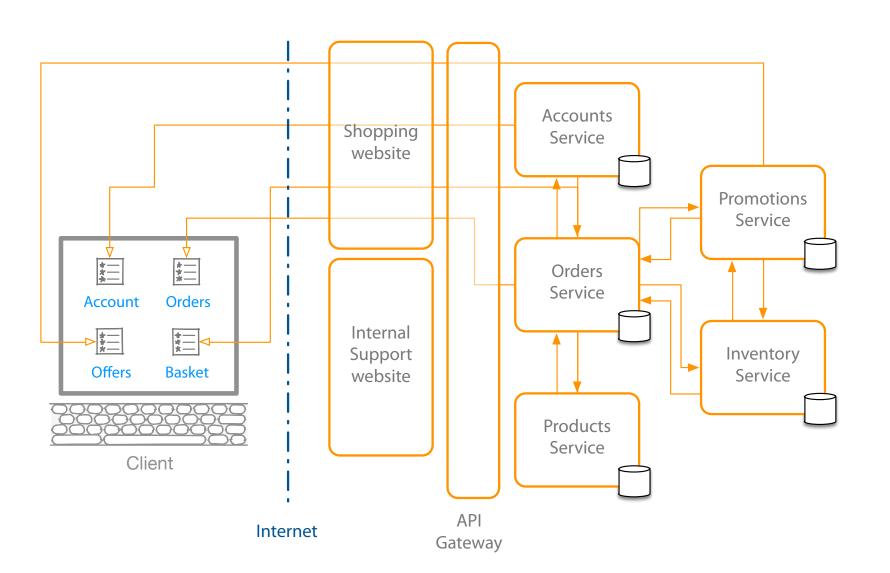

## Microservices: The Monolithic

# Emergence of Microservices

Why Now? | Benefits

# Emergence of Microservices: Why Now?

Need to respond to change quickly

Need for reliability

Business domain-driven design

Automated test tools

Release and deployment tools

On-demand hosting technology

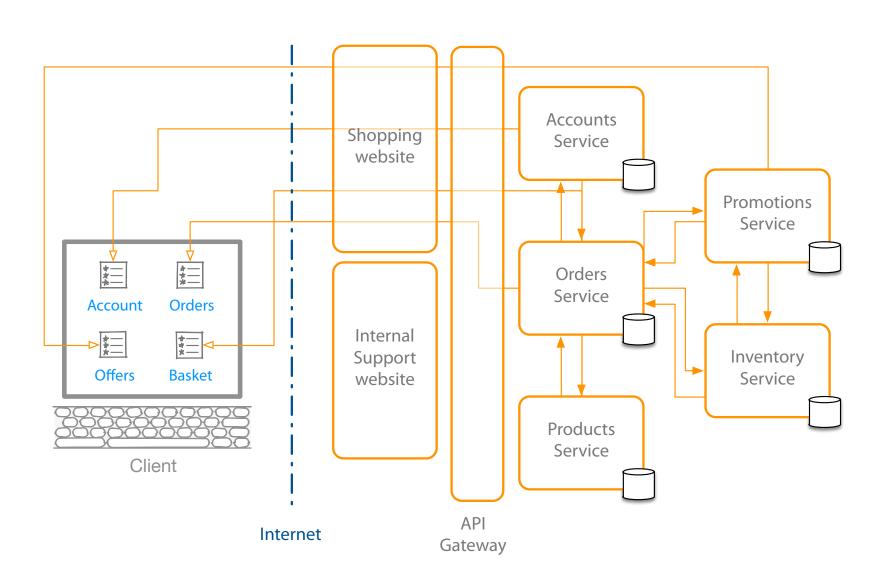

On-line cloud services

Need to embrace new technology

Asynchronous communication technology

Simpler server side and client side technology

## Emergence of Microservices: Benefits

Shorter development times

Reliable and faster deployment

Enables frequent updates

Decouple the changeable parts

Security

Increased uptime

Fast issue resolution

Highly scalable and better performance

Better ownership and knowledge

Right technology

**Enables distributed teams** 

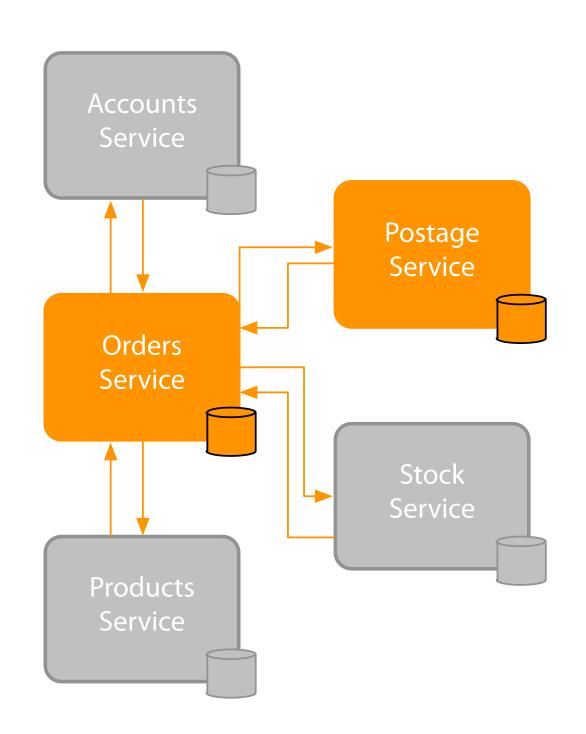

# Microservices Design Principles

## Microservices Design Principles: Introduction

**Business Domain** High Cohesion Autonomous Centric Observable Automation Resilience

# Microservices Design Principles: High Cohesion

```
Single focus
```

Single responsibility

SOLID principle

Only change for one reason

Reason represents

A business function

A business domain

Encapsulation principle

OOP principle

Easily rewritable code

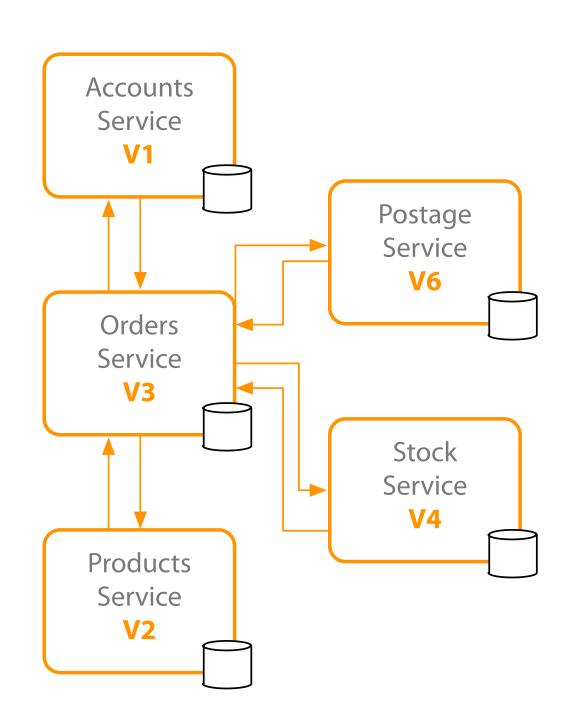

Why

Scalability

**Flexibility** 

Reliability

## Microservices Design Principles: Autonomous

Loose coupling

Honor contracts and interfaces

Stateless

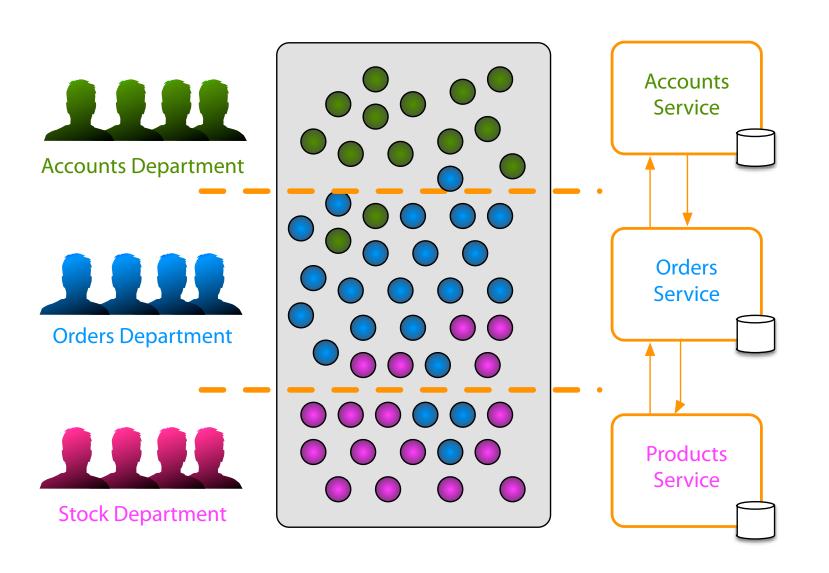

Independently changeable

Independently deployable

Backwards compatible

Concurrent development

## Design Principles: Business Domain Centric

Service represents business function

Accounts Department Postage calculator

Scope of service

Bounded context from DDD

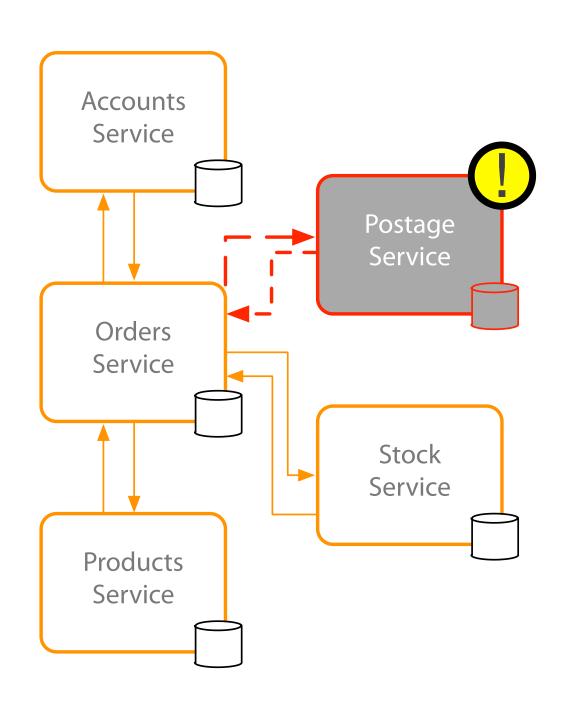

Identify boundaries\seams

Shuffle code if required

Group related code into a service Aim for high cohesion

Responsive to business change

## Microservices Design Principles: Resilience

#### Embrace failure

Another service
Specific connection
Third-party system

Degrade functionality

Default functionality

Multiple instances

Register on startup Deregister on failure

#### Types of failure

**Exceptions\Errors** 

Delays

Unavailability

#### Network issues

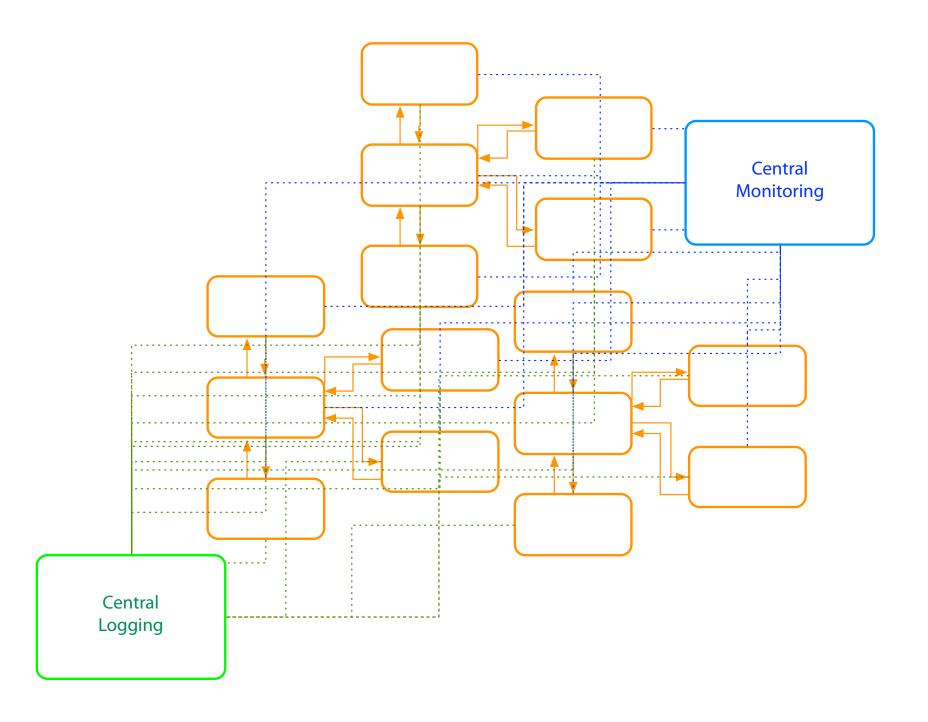

Delay

Unavailability

### Validate input

Service to service
Client to service

# Microservices Design Principles: Observable

System Health

Status

Logs

**Errors** 

Centralized monitoring

Centralized logging

Why

Distributed transactions

Quick problem solving

Quick deployment requires feedback

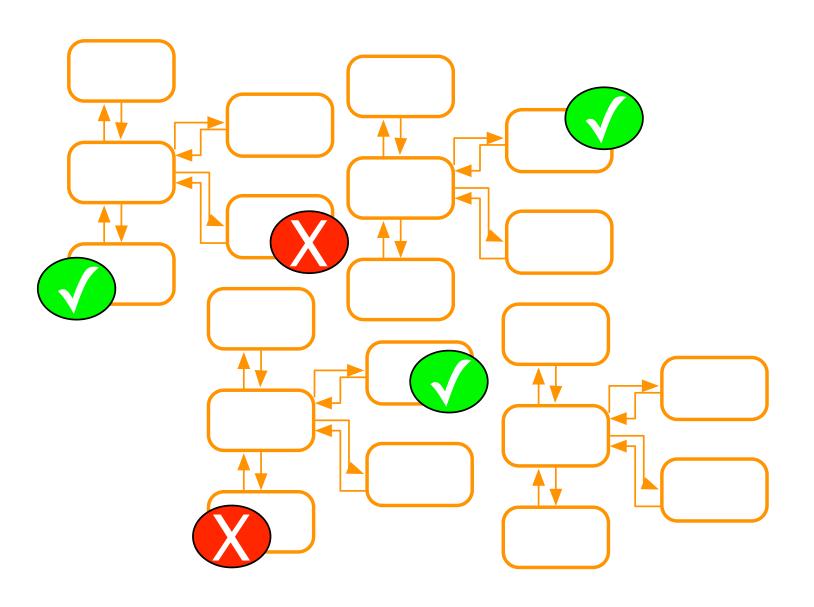

Data used for capacity planning

Data used for scaling

Whats actually used

Monitor business data

# Microservices Design Principles: Automation

### Tools to reduce testing

Manual regression testing
Time taken on testing integration
Environment setup for testing

### Tools to provide quick feedback

Integration feedback on check in Continous Integration

### Tools to provide quick deployment

Pipeline to deployment
Deployment ready status
Automated deployment

Reliable deployment Continuous Deployment

### Why

Distributed system

Multiple instances of services

Manual integration testing too time consuming

Manual deployment time consuming and unreliable
